Abstracts

Copper foil is an extremely thin copper strip or sheet with a thickness of less than 200um, which is processed by electrolysis, calendaring or sputtering. It is widely used in electronic circuits, lithium batteries and other related fields. According to the difference in processing methods, copper foil can be divided into electrolytic copper foil and rolled copper foil. Electrolytic copper foil is made by making copper raw materials into copper sulfate solution, and then using electrolytic equipment to deposit the solution under the action of direct current. Rolled copper foil is made by repeatedly rolling copper raw materials by physical means. Lithium battery copper foil is a type of electrolytic copper foil. Due to its good conductivity, flexibility, mechanical processing performance, mature processing technology and low processing cost, copper foil is the first choice for lithium battery negative electrode material carrier and current collector, which plays the role of conducting and collecting lithium battery current to generate maximum output current.

The global Lithium Battery Grade Copper Foil market size was estimated at USD 7128.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 20.50% during the forecast period.
