Abstracts

Lithium Hexafluorophosphate, white crystal or powder, has strong deliquescence; it decomposes when exposed to air or heated, and lithium hexafluorophosphate decomposes rapidly due to the action of water vapor when exposed to air or heated, and releases PF₅ to produce white smoke. The electrolytes currently used in lithium iron phosphate batteries on the market mainly include lithium perchlorate, lithium fluoride salt, lithium hexafluorophosphate, etc. Batteries made of lithium perchlorate are not effective at low temperatures and may explode. Their use has been banned in Japan and the United States. Batteries made of fluorine-containing lithium salts have good performance, no explosion hazard, and strong applicability. Batteries made of lithium hexafluorophosphate have good battery performance, no explosion hazard, and strong applicability. In the future, the disposal of waste batteries will be relatively simple and environmentally friendly. Therefore, the market prospects of batteries made of lithium hexafluorophosphate are very broad.

The global Lithium Hexafluorophosphate Electrolyte market size was estimated at USD 2543.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
