## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Lithium Niobate Thin Film competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Lithium Niobate Thin Film (TFLN) refers to an ultra-thin layer of lithium niobate deposited or bonded onto a substrate (such as silicon dioxide, sapphire, or glass) using techniques like epitaxial growth or ion slicing. Compared to bulk lithium niobate, TFLN offers superior optical confinement, lower propagation loss, and better compatibility with photonic integration. It is widely used in high-speed optical modulators, integrated photonic chips, optical filters, and frequency conversion devices in next-generation optoelectronic applications. Lithium Niobate Thin Film (TFLN) represents a breakthrough substrate for advanced photonic integration. It consists of a nanometer-scale lithium niobate ( $\text{LiNbO}_3$ ) layer bonded onto an insulating carrier, such as  $\text{SiO}_2$  or glass. This thin-film structure offers strong optical confinement, high electro-optic coefficient ( $r_{33}$ ), and ultra-low propagation loss, making it ideal for high-speed optical modulators and next-generation integrated photonic circuits. TFLN are mainly produced in 4-inch and 6-inch formats. The industry is rapidly transitioning to 6-inch due to better compatibility with existing CMOS and silicon photonics foundries. Jinan Jingzheng Electronics stands out as one of China's most commercially advanced TFLN wafer manufacturers. With a focus on 4-inch and 6-inch bonded wafers and reliable output, it supports domestic and international customers in modulators and photonics research. Its route favors mechanical exfoliation combined with direct bonding, balancing yield and cost. Optical communication modulators, especially for 400G/800G+ coherent links in AI and data center interconnects, are the primary commercial application of TFLN wafers. Compared to conventional bulk  $\text{LiNbO}_3$  devices, TFLN-based modulators offer ultra-compact footprint, high bandwidth (>60GHz), low drive

voltage, and superior scalability. TFLN is also gaining attention in optical resonators, acousto-optic modulators, frequency combs, and quantum photonic chips. Looking forward, key trends in the TFLN wafer market include: A transition toward 6-inch and even 8-inch wafers for improved yield and scalability; Formation of a foundry ecosystem, particularly in China, integrating wafer suppliers, photonic fabs, and device/system companies; Increasing demand driven by AI, quantum, and high-speed optical interconnect markets.

The global Lithium Niobate Thin Film market size was estimated at USD 108.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 40.50% during the forecast period.
