## Abstracts

Live cell imaging is a research method that studies the cellular structure and function of living cells through microscopic observation. It can display and quantify the dynamic changes of cells in real time. and can study cellular and subcellular structure, function, and organization in living systems, helping to develop assays that are more biologically relevant and better predictive of the body's response to new drug candidates. Live cell imaging can be used in a variety of research directions and biological applications - whether it is monitoring the long-term dynamics of living cells or detecting fluorescent markers. Sophisticated live cell imaging systems can regulate environmental conditions to maintain cell health and activity while monitoring molecular and cellular dynamics data from single cells to the organismal level. From studying fast kinetic events to long-term time-lapse detection, automated live-cell imaging allows direct observation of dynamic biological processes in living cells and generates a wealth of cellular information. Live cell imaging requires the user to carefully balance imaging conditions - with the goal of collecting the minimum essential data and thus minimizing perturbation of the model system. While it may be tempting to use higher illumination power, longer camera exposure times, etc. to obtain higher signal-to-noise ratio (SNR) images, it is important to understand that phototoxicity compromises the physiological integrity and continued viability of the system . Furthermore, photobleaching imposes a practical limit on the number of photons extracted from each fluorophore during an experiment. There is a growing demand for various live cell imaging technologies and processes, such as live cell markers, live cell imaging buffers, live cell imaging incubators, nanoscale live cell imaging, live cell imaging organoids, live cell imaging reagents, T cells imaging, live cell imaging endocytosis, 3d live cell imaging, live cell imaging apoptosis, f-actin live cell imaging, fluorescent probes for cytoskeleton live cell imaging, live cell imaging antibodies, live cell imaging Histopathology, live cell imaging biosensors are also driving the overall global market growth.
