### Report Overview

Low-E (emissivity) glass, also known as low-emissivity glass, is a type of energy-efficient glass that has been treated with a thin, transparent coating of metal or metal oxide on one or both surfaces. This coating significantly reduces the amount of ultraviolet (UV) and infrared (IR) radiation that can pass through the glass, thereby reducing heat transfer and improving the insulation properties of windows and other glazed structures. The primary purpose of Low-E glass is to enhance thermal performance by reflecting indoor heat back into the building during winter and blocking outdoor heat from entering during summer, which ultimately leads to energy savings and increased comfort. Low-E glass is commonly used in residential, commercial, and automotive applications due to its ability to provide a balance between natural light transmission and thermal control.
