### Report Overview

Low Friction Seals are engineered components designed to minimize friction and wear between moving parts in various mechanical systems. These seals are typically made from materials with low friction coefficients, such as polytetrafluoroethylene (PTFE), graphite, or other specialized polymers, which allow for smooth operation with minimal resistance. They are often used in applications where reducing energy consumption, heat generation, and wear is critical, such as in bearings, piston rings, and valve seals. The primary function of low friction seals is to maintain a tight seal while allowing for efficient movement, ensuring the longevity and performance of the equipment they are integrated into.
