Report Overview

A Low g-sensitivity OCXO (Oven-Controlled Crystal Oscillator) is a high-precision frequency control device designed to maintain stable and accurate frequency output even under varying gravitational forces. This type of OCXO is specifically engineered to have a low sensitivity to changes in gravitational acceleration (g), which can affect the performance of standard OCXOs in environments where gravitational forces are not constant, such as in aerospace applications or during transportation. The low g-sensitivity OCXO achieves this through advanced design techniques that minimize the impact of gravity on the oscillating crystal, ensuring that the frequency remains stable and accurate across a wide range of gravitational conditions. This makes it an ideal choice for applications requiring high reliability and precision in dynamic environments, such as satellite communication systems, navigation equipment, and precision timing devices.
