Report Overview

A Low Hydrogen Electrode (LHE) is a type of electrode used in various electrochemical processes, particularly in the production of high purity metals and alloys. It is designed to minimize the presence of hydrogen in the electrolyte, which can cause impurities and affect the quality of the final product. The LHE is typically made from a nickel or nickel-based alloy, which has a low overvoltage for hydrogen evolution. This material selection allows for efficient oxygen evolution at the anode, reducing the amount of hydrogen gas produced during the electrolysis process. The low hydrogen content in the electrolyte ensures that the metal being deposited has fewer impurities, resulting in a purer final product. This type of electrode is crucial in applications where high purity metals are required, such as in the aerospace, electronics, and chemical industries.
