### Report Overview

Low Melting Yarns are a unique type of textile material specifically designed for applications where controlled melting is required. These yarns are engineered with a low melting point, typically below 150°C, which allows them to melt and fuse upon exposure to moderate heat. This characteristic is particularly useful in various industries such as automotive, where they are used in the production of airbags, and in the electronics sector for the creation of solderable components. The yarns are composed of thermoplastic polymers that, when heated, soften and bond with adjacent fibers without the need for additional adhesives or solvents. This feature not only facilitates assembly processes but also contributes to the production of lighter and more efficient products. Low Melting Yarns are also valued for their ability to provide a secure bond that maintains strength and integrity under stress, making them a critical component in safety-critical applications.
