Report Overview

A Low Pressure Filter is a filtration system designed to remove impurities and contaminants from liquids or gases under low pressure conditions. It operates by forcing the fluid through a porous medium or filter element, which traps particles and allows the clean fluid to pass through. The primary function of a low pressure filter is to maintain fluid quality and prevent damage to downstream equipment or processes. These filters are commonly used in various industries, such as water treatment, HVAC systems, and industrial processes, where maintaining fluid cleanliness is crucial. Key features of low pressure filters include their ability to handle low pressure differentials, their compatibility with various types of fluids, and their efficiency in removing particles of different sizes. The design of low pressure filters may vary, but they typically consist of a housing, a filter element, and a mechanism for replacing or cleaning the filter media.
