Report Overview

Low-pressure Nanofiltration (NF) Hollow Fiber Membranes are advanced filtration materials designed for water treatment applications. These membranes are characterized by their nanofiltration capabilities, which allow them to selectively remove contaminants from water while maintaining a relatively low operating pressure. The hollow fiber structure of these membranes provides a high surface area to volume ratio, enhancing their filtration efficiency and throughput. They are engineered to be robust and durable, withstanding the demands of continuous water treatment processes. The low-pressure operation of these membranes contributes to energy efficiency, making them an environmentally friendly choice for water purification. These membranes are typically made from polymeric materials and are designed to target specific contaminants, such as organic molecules, dyes, and certain salts, depending on their intended application in industries like food and beverage processing, pharmaceuticals, and municipal water treatment.
