Report Overview

Low Sodium Pseudo Boehmite is a type of aluminum oxide, specifically an aluminum hydroxide, used in various industrial applications. It is characterized by its low sodium content, which is beneficial for certain processes that require minimal sodium presence. This product is derived from the pseudo boehmite form, which is an amorphous or poorly crystalline form of aluminum oxide hydroxide. It is often used as a precursor in the production of alumina, aluminum salts, and other aluminum-based compounds. Low Sodium Pseudo Boehmite is valued for its high purity, controlled particle size, and specific surface area, which contribute to its performance in applications such as water treatment, catalysts, and the manufacturing of ceramics and refractory materials. Its low sodium content makes it particularly suitable for applications where high purity and the absence of sodium impurities are critical.
