Report Overview

Low-substituted Hydroxypropyl Cellulose (L-HPC) is a type of cellulose ether derivative, specifically a water-soluble polymer. It is derived from natural cellulose, which is obtained from plant sources such as cotton linters or wood pulp. The "low-substituted" term refers to the degree of substitution (DS) of hydroxypropyl groups on the cellulose backbone, which is relatively low compared to other hydroxypropyl cellulose variants. This characteristic gives L-HPC unique properties, such as improved solubility in cold water, high viscosity at low concentrations, and excellent film-forming capabilities. L-HPC is widely used in various industries, including pharmaceuticals for controlled release formulations, food and beverages as a stabilizer and thickener, and cosmetics for skin care products due to its moisturizing and film-forming properties. Its low substitution also contributes to its compatibility with other polymers and its ability to form gels with unique rheological properties.
