Abstracts

The low-temperature double distillation tester is a device used to conduct distillation analysis of two or more samples simultaneously under low-temperature conditions. Compared with ordinary distillation testers, low-temperature double distillation testers can perform distillation operations at lower temperatures to adapt to certain temperature-sensitive samples or experimental requirements that require maintaining low temperature conditions. It usually consists of two or more independent distillation units, each of which can process different samples simultaneously. This kind of testing instrument is widely used in laboratories in the fields of chemistry, biology, medicine and other fields to analyze and process samples that are sensitive to low temperature.

The global Low Temperature Double Distillation Tester market size was estimated at USD 18.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.75% during the forecast period.
