Abstracts

Lower extremity exoskeletons developed for human locomotion assistance are used to help patients who have completely lost mobility in the lower limbs due to conditions such as SCI, multiple sclerosis, etc. These systems offer external torque at the location of human joints to replace the patients' impaired motor function, enabling them to perform daily movements such as standing up, sitting down and walking. They can function as assistive and rehabilitative devices. Most of these exoskeletons require the patients to balance themselves and therefore a healthy upper body is required. Compared to stationary systems, powered robotic exoskeletons are compact, lightweight and portable and can therefore be potentially used at home.

The global Lower Extremity Powered Exoskeleton market size was estimated at USD 525.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
