Abstracts

The magneto-inductive speed sensor is a sensor that uses the principle of magneto-induction to measure the speed of an object. It determines speed by detecting changes in the magnetic field produced when an object moves. Such sensors typically consist of a generator that emits a magnetic field and a receiver that detects changes in the magnetic field. When an object moves, its position relative to the sensor causes changes in the magnetic field, and the sensor can measure this change to calculate the object's speed. Magnetically inductive speed sensors are commonly used in industrial automation, vehicle navigation, and other applications that require precise speed measurement.

The global Magnetic Inductive Velocity Sensor market size was estimated at USD 145.85 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
