Report Overview

A Magnetic Rotational Speed Sensor is a type of sensor that measures the rotational speed of a rotating object, such as an engine or motor, by detecting the magnetic field generated by the object. This device typically consists of a sensor head and a target wheel, which is attached to the rotating object. As the target wheel rotates, it passes by the sensor head, generating a magnetic field that the sensor can detect. The sensor then converts these magnetic signals into electrical signals, which can be further processed to determine the rotational speed of the object. This technology is widely used in various industries, including automotive, aerospace, and industrial automation, to monitor and control the performance of rotating machinery. It offers advantages such as high accuracy, reliability, and non-contact measurement, making it a preferred choice for applications where precise speed monitoring is critical.
