Abstracts

A magnetically coupled external gear pump is a type of positive displacement pump designed to transfer fluids using an innovative magnetic coupling mechanism, which eliminates the need for mechanical seals. This design features two gears—an external drive gear and an internal driven gear—both encased in a housing, with a set of permanent magnets used to transmit rotational motion from the drive shaft to the gears without direct physical contact. This magnetic coupling not only ensures a leak-free operation by preventing fluid from escaping through seals but also allows the pump to handle a wide range of fluids, including those that are corrosive, abrasive, or high-viscosity. The absence of mechanical seals reduces maintenance requirements and extends the pump's lifespan, making it ideal for demanding applications in industries such as chemical processing, pharmaceuticals, and food and beverage. The pump's ability to deliver precise, consistent flow rates while maintaining a high level of containment and reliability underscores its value in applications where fluid integrity and operational safety are critical.

The global Magnetically Coupled External Gear Pump market size was estimated at USD 380.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
