Abstracts

A Magnetically Coupled Internal Gear Pump is a type of positive displacement pump that uses an internal gear mechanism for fluid transfer, coupled with a magnetic drive to create a leak-free, sealless design. The pump consists of two gears: a larger external gear (rotor) and a smaller internal gear (idler), which rotate together to create fluid flow. The magnetic coupling replaces the traditional shaft seal, allowing the pump to transfer liquids without any physical connection between the motor and the pump chamber. This eliminates the risk of leaks, making it ideal for handling hazardous, toxic, or corrosive fluids. Magnetically coupled internal gear pumps are commonly used in industries like chemical processing, pharmaceuticals, food and beverage, and petrochemicals, where both high efficiency and safety are critical. The design ensures precise flow control, low maintenance, and reliable operation in applications where fluid containment is essential.

The global Magnetically Coupled Internal Gear Pump market size was estimated at USD 324.65 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
