Report Overview

A Manual Solid Phase Microextraction (SPME) Instrument is a laboratory tool designed for the extraction and pre-concentration of target analytes from various sample matrices, such as liquid, gas, or solid. This technique employs a small fiber coated with a stationary phase that selectively absorbs the analytes of interest. The instrument typically consists of a syringe-like device that holds the fiber, allowing the user to manually expose the fiber to the sample and then retract it for analysis. The extracted analytes are then thermally desorbed into a gas chromatograph or other analytical instruments for detection and quantification. The manual SPME instrument is valued for its simplicity, versatility, and minimal sample preparation requirements, making it suitable for a wide range of applications in fields such as environmental monitoring, food safety, and forensic science.
