Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Marine Fuel Supply System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The marine fuel supply system is a system used to store, transport and supply fuel on a ship. The design and operation of this system is crucial to the performance and energy efficiency of the ship. New energy ships mainly use low-carbon fuels to replace traditional fuels. According to the fuel type, they can be divided into LNG, methanol, ammonia and hydrogen. The sales volume in this report is based on the order volume of the year, not the delivery volume. The general trend of changes in the global marine ship fuel supply system market depends largely on the order volume. In addition, the shipbuilding time is long and the market is relatively fragmented. The global ship fuel supply system market is undergoing structural changes, with the core driving force coming from IMO's strict decarbonization regulations (CII, EEXI, fuel carbon intensity standards) and the shipping industry's urgent need for large-scale application of alternative fuels. LNG, methanol and ammonia supply systems are equipment and technical systems that provide ships with different types of clean energy fuels. These fuels are widely regarded as an alternative to traditional fuels to reduce carbon emissions and environmental impacts of ships. Since the LNG fuel supply system started early, it currently occupies a dominant position, followed by methanol fuel. Downstream ammonia fuel ships are still in the design and research and development stage, and the ammonia fuel supply system delivered by Mitsubishi Heavy Industries in 2022 is not for ships, but for testing ammonia fuel engines. According to information disclosed by Samsung Heavy Industries, Daewoo Shipbuilding and China Shipbuilding Group, ammonia fuel ships will be launched as early as 2025. In this way, the commercialization of ammonia fuel supply systems will not be far away. In 2022, the

China has successively promulgated various policies, making clear arrangements in scientific and technological innovation, manufacturing quality improvement, offshore fishery development, green and low-carbon development, etc., which have pointed out the direction for the development of China's shipbuilding and marine industry. The implementation of relevant policies will effectively promote the development of China's shipbuilding industry towards high-end, intelligent, digital, green and low-carbon development, and strongly support the improvement of major technical equipment manufacturing capabilities.

The global Marine Fuel Supply System market size was estimated at USD 1441.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 45.50% during the forecast period.
