### Report Overview

Marker Bands and Ring Electrodes are specialized medical devices primarily used in the field of electroencephalography (EEG) and other related diagnostic procedures. These devices consist of two main components: marker bands and ring electrodes. Marker bands are thin, flexible strips that are placed on the patient's head to mark specific locations for electrode placement, ensuring accurate and consistent positioning during multiple EEG sessions. Ring electrodes, on the other hand, are circular conductive devices that are attached to the patient's scalp to record electrical activity from the brain. They are made of materials such as silver/silver chloride, which provide excellent electrical conductivity and minimize skin irritation. The combination of marker bands and ring electrodes allows for precise and reliable data collection, which is crucial for accurate diagnosis and treatment planning in neurological disorders.
