Abstracts

This report mainly focuses on materials recovery facility (MRF) market. A materials recovery facility, materials reclamation facility, materials recycling facility or multi re-use facility (MRF, pronounced "murf") is a specialized waste sorting and recycling system that receives, separates and prepares recyclable materials for marketing to end-user manufacturers. Generally, the main recyclable materials include ferrous metal, non-ferrous metal, plastics, paper, glass. There are two primary types of materials recovery facilities: clean and dirty. Market drivers In order to promote the circular economy, reduce resource consumption and environmental pollution, governments around the world have introduced a series of supporting policies. These policies encourage waste sorting, recycling and reuse, and provide ample space for the development of material recovery facilities. As people's awareness of environmental protection increases, more and more consumers and businesses begin to pay attention to waste disposal and recycling. This rise in environmental awareness has led to an increasing market demand for material recycling facilities. The continuous advancement of material recycling technology has significantly improved the efficiency and quality of waste recycling. Advanced sorting, crushing, separation and recycling technologies have enabled more waste to be converted into valuable resources, thus promoting the development of material recovery facilities. As the global economy develops and population grows, the demand for resources continues to increase. However, many resources are limited, so recycling and reusing waste is an important way to replenish them. This is driving the market demand for material recovery facilities. Market risks: Fluctuations in raw material prices can affect operating costs and profits at material recovery facilities. If raw material prices continue to rise, then the cost of recycling and reuse will also increase accordingly, reducing the profitability of material recovery facilities. The market demand for material recovery facilities is influenced by many factors, including policies, environmental awareness, technological advances, and resource shortages. If these factors change, then market

demand will fluctuate accordingly. Imbalances in market supply and demand may cause material recovery facilities to face the risk of operating difficulties or reduced profits. As technology continues to advance, more efficient and environmentally friendly recycling technologies and equipment may emerge. The emergence of these new technologies may displace existing material recovery facilities, causing their market value to decrease or put them at risk of being eliminated. Changes in environmental regulations can have a direct impact on material recovery facilities. If regulations become more stringent, then more money may need to be invested to improve facilities to meet regulatory requirements. In addition, changes in regulations may also lead to increased volatility or uncertainty in market demand.

The global Materials Recovery Facility (MRF) market size was estimated at USD 6589.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
