Report Overview

A mechanical friction torque limiter is a safety device used to protect machinery and equipment from damage caused by overloading or sudden torque spikes. It consists of two rotating elements connected by friction discs or rollers that transmit torque from one element to the other. When the torque exceeds a preset limit, the friction between these elements increases, causing slippage and decoupling of the drive, thus preventing the transmission of excessive torque to downstream components. This slip action protects the drivetrain from damage by disengaging the load until the overload condition is corrected. Mechanical friction torque limiters are commonly used in various industrial applications such as conveyor systems, power transmission equipment, and machine tools, where sudden overloads or jams can occur. They offer advantages such as simplicity, reliability, and ease of maintenance, making them essential components in safeguarding machinery and ensuring operational safety.
