Abstracts

Medical Ge-Ga generators are a special radionuclide generator that uses Ge-68 (^{68}Ge) as the parent isotope and continuously produces Gallium-68 (^{68}Ga) through its radioactive decay. Gallium-68 is a positron emitter with a short half-life (about 67.71 minutes) and is suitable for medical diagnostic technologies such as PET (positron emission computed tomography). The germanium gallium generator usually consists of a closed system that contains a carrier (such as a titanium dioxide layer on a borosilicate glass column) with germanium-68 adsorbed on it. Germanium-68 releases electrons and neutrons during the decay process, and some of the decay products are gallium-68. Gallium-68 can be eluted from the generator through a specific eluent (such as sterile ultrapure 0.1 molar hydrochloric acid) for subsequent medical applications.

The global Medical Germanium Gallium Generator market size was estimated at USD 135.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
