### Report Overview

Yttrium-90 (Y-90) is a radioactive isotope widely used in nuclear medicine, particularly for targeted radiation therapy in oncology. It emits beta radiation, making it effective for treating tumors via radioembolization and radioimmunotherapy, where microspheres or antibodies deliver the isotope directly to cancer cells. The market for Y-90 is driven by increasing demand for minimally invasive cancer treatments, advancements in radiopharmaceuticals, and rising cancer prevalence globally. Key applications include liver cancer, lymphoma, and bone metastases, with growing research exploring its potential in other malignancies. The market faces challenges such as high production costs, stringent regulatory requirements, and limited availability of nuclear reactors for isotope generation. However, partnerships between pharmaceutical companies and research institutions, along with innovations in production and delivery methods, are expected to sustain growth. Geographically, North America and Europe dominate due to advanced healthcare infrastructure, while Asia-Pacific shows rapid growth due to expanding medical access and increasing cancer cases. Competition includes major players like Boston Scientific, Sirtex Medical, and emerging radiopharmaceutical firms investing in next-generation Y-90 therapies.
