Abstracts

Ventricular Septal Defect (VSD) is the most common type of congenital heart disease. A VSD is a defect in the ventricular septum, the wall that separates the left and right ventricles of the heart. The heart has 4 chambers: 2 upper chambers (atria) and 2 lower chambers (ventricles). Highly oxygenated blood flows from the left atrium to the left ventricle and then to the body, where oxygen is used by vital organs. Less oxygenated blood flows from the right atrium to the right ventricle and then to the lungs. In the lungs, it absorbs more oxygen. usually. The septal wall prevents blood from mixing between the two chambers of the heart. The VSD allows oxygen-rich (red) blood to abnormally pass from the left ventricle through the opening in the septum. It then mixes with oxygen-deprived (blue) blood in the right ventricle. Larger VSDs can lead to pulmonary vascular hypertension. Higher pressure results in lower oxygen levels in the body.

The global Medical Ventricular Septal Defect Occluder market size was estimated at USD 425.6 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
