Abstracts

Mid frequency sputtering is a common thin film deposition technique used to deposit metal or compound thin films, such as metal oxides, nitrides, etc., on substrate surfaces. The intermediate frequency sputtering power supply can provide stable electrical energy, control the current and voltage during the sputtering process, and ensure the uniformity and quality of the film. In the manufacturing process of liquid crystal displays (LCDs) and organic light-emitting diodes (OLEDs), intermediate frequency sputtering technology is required to deposit transparent conductive oxide (such as ITO) thin films or metal thin films. The intermediate frequency sputtering power supply can provide sufficient power and stability to ensure high-quality deposition of thin films.

The global Medium Frequency Sputtering Power Supply market size was estimated at USD 285.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
