### Report Overview

Medium and low-grade non-grain-oriented (NGO) silicon steel is a type of electrical steel used primarily in applications where high magnetic permeability and low core loss are not critical, such as small motors, transformers, and other electromagnetic devices. Unlike grain-oriented silicon steel, which is optimized for directional magnetic properties, NGO silicon steel exhibits isotropic magnetic behavior, making it suitable for components with rotating or alternating magnetic fields. The medium and low grades refer to the varying levels of silicon content (typically 1-3%) and magnetic performance, with lower grades being more cost-effective but offering reduced efficiency. These materials are favored in cost-sensitive industries where performance trade-offs are acceptable, such as household appliances, automotive systems, and industrial machinery. The market for these grades is driven by demand from emerging economies, growth in renewable energy infrastructure, and the expansion of consumer electronics, though it faces competition from higher-efficiency alternatives and fluctuating raw material costs.
