### Report Overview

Mesalazine enteric-coated tablets are a pharmaceutical formulation of mesalazine (5-aminosalicylic acid), an anti-inflammatory drug primarily used to treat inflammatory bowel diseases (IBD), including ulcerative colitis and Crohn's disease. The enteric coating ensures delayed release in the lower gastrointestinal tract, minimizing systemic absorption and maximizing localized therapeutic effects while reducing adverse reactions. The market for mesalazine enteric-coated tablets is driven by the increasing prevalence of IBD globally, attributed to factors such as dietary changes, genetic predisposition, and environmental influences. Demand is further supported by the growing preference for targeted therapies with fewer side effects compared to systemic corticosteroids or immunosuppressants. Key competitors include branded and generic manufacturers, with major pharmaceutical companies dominating in developed markets while generics gain traction in cost-sensitive regions. Regulatory approvals, patent expirations, and the expansion of biosimilars influence competitive dynamics, while advancements in drug delivery technologies and personalized medicine present future growth opportunities. Emerging markets are expected to witness higher growth due to improving healthcare infrastructure and rising disease awareness, though pricing pressures and stringent regulatory requirements remain challenges.
