Report Overview

A Metal Compression Spring is a type of mechanical spring made from metal wire, which is designed to store and release energy when compressed. It functions by undergoing elastic deformation when subjected to an external force, and then returning to its original shape once the force is removed. These springs are widely used in various applications, such as in mechanical devices, automotive components, and industrial machinery, to absorb shock, maintain tension, or provide force. The design of a metal compression spring can vary based on factors like material selection, wire diameter, coil diameter, number of active coils, and end configurations, which all influence its load-bearing capacity, spring rate, and overall performance. Common materials used for metal compression springs include spring steel, stainless steel, and other alloys that offer a balance of strength, durability, and elasticity.
