Report Overview

Metal Hydroxide Flame Retardants (MHFRs) are a class of inorganic flame retardant compounds that are widely used in various industries to enhance the fire resistance of materials. These compounds are characterized by their ability to absorb heat and release water vapor when exposed to high temperatures, which helps to cool the material and slow down the combustion process. MHFRs are typically composed of metal ions, such as aluminum, magnesium, or zinc, combined with hydroxide ions. They are known for their high thermal stability, non-toxicity, and low smoke emission, making them environmentally friendly alternatives to traditional halogenated flame retardants. MHFRs are commonly used in applications such as polymers, textiles, coatings, and electronic devices to prevent or mitigate the effects of fires.
