Abstracts

Metal Powder Injection Molding (MIM) is a process that combines the flexibility of plastic injection molding with the mechanical and thermal properties of metal. It involves mixing finely powdered metal with a binder material to create a 'feedstock' that is then shaped and solidified using injection molding. The process is particularly suited for producing small, complex-shaped metal components with outstanding mechanical properties. After molding, the parts undergo debinding and sintering to remove the binder and densify the powders, resulting in high-density, net-shaped components.

The global Metal Powder Injection Molding Parts market size was estimated at USD 5236.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
