Abstracts

Metalens is a lens developed based on metasurface technology and using micro-nano technology and dielectric materials. Metalenses will completely subvert the cumbersome lens groups in traditional optical devices, realize the original lens functions of several millimeters or even centimeters with a thickness of microns, and integrate the functions of multiple optical elements into one, greatly reducing the size and weight of the imaging system, simplifying the structure and optimizing performance. Metalens have broad application prospects in automotive electronics. Its ultra-high resolution, thin and light design, and multi-functional integration can significantly improve the performance and user experience of vehicle cameras, lidar, head-up display systems, surround view systems, and internal monitoring systems. With the development of technology and the improvement of manufacturing processes, metalens are expected to become an important and indispensable component in automotive electronic systems in the future, improving the safety and reliability of autonomous driving and driver assistance systems.

The global Metalens For Automotive Electronics market size was estimated at USD 125.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 28.75% during the forecast period.
