### Report Overview

Metalens design software is a specialized computational tool used to simulate, optimize, and analyze the performance of metalenses?flat, nanostructured optical components that manipulate light at subwavelength scales. These software solutions integrate advanced electromagnetic simulation techniques, such as finite-difference time-domain (FDTD) or rigorous coupled-wave analysis (RCWA), with optimization algorithms to enable the precise design of meta-atoms, the building blocks of metalenses. Key functionalities often include wavelength-specific phase profile modeling, aberration correction, and efficiency evaluation, catering to applications in imaging, augmented reality (AR), LiDAR, and telecommunications. The software is primarily utilized by photonics researchers, optical engineers, and semiconductor manufacturers, with demand driven by the growing adoption of compact, lightweight optical systems in consumer electronics and industrial applications. Market growth is further propelled by advancements in nanofabrication techniques and increasing investments in metasurface research, though adoption remains constrained by high computational requirements and the niche expertise needed to operate such tools effectively. Leading providers include established simulation software companies like Lumerical (Ansys), COMSOL, and Zemax, alongside specialized startups focusing on AI-driven design automation.
