Report Overview

Metallic Nanowires are ultra-thin, elongated structures made from metal materials, typically with diameters ranging from a few nanometers to several tens of nanometers. These nanowires exhibit unique physical, chemical, and optical properties due to their high surface area to volume ratio and quantum confinement effects. They are synthesized through various methods, including chemical vapor deposition, electrochemical deposition, and template-assisted synthesis. Metallic nanowires have a wide range of applications in fields such as electronics, optoelectronics, energy storage, and catalysis. Some common metals used in the fabrication of metallic nanowires include gold, silver, copper, and platinum. Their small size and high aspect ratio make them suitable for use in nanoscale devices and systems, where they can provide enhanced performance and functionality compared to their bulk counterparts.
