Abstracts

Heart metastatic malignant melanoma is the late stage of tumor development. Treatment is mainly to alleviate symptoms and support the treatment of the whole body, such as anemia, edema, hypoproteinemia. For pleural or pericardial effusion should be punctured as soon as possible or catheter drainage, in order to reduce the cardiopulmonary compression. Chemotherapy and immunotherapy can be used in patients with better systemic status, but malignant melanoma is not sensitive to the former, while the latter has a certain effect on enhancing the patient's immunity. Radiotherapy can be used as an experimental therapy and can also confirm the presence or absence of cardiac metastasis. Arrhythmias are sometimes controlled by digitalis therapy.
