Report Overview

A Methanol Fuel Cell is an electrochemical device that converts the chemical energy stored in methanol (CH₃OH) into electrical energy through a series of redox reactions. It operates by allowing methanol and oxygen to react at the anode and cathode, respectively, generating electrons and ions that flow through an external circuit, creating an electric current. Methanol fuel cells are considered a promising alternative to traditional hydrogen fuel cells due to methanol's higher energy density, lower storage and transportation challenges, and its compatibility with existing liquid fuel infrastructure. These fuel cells can be used in various applications, including portable electronics, transportation, and backup power systems, offering a cleaner and more efficient energy solution compared to fossil fuels.
