Report Overview

A Methanol Fuel Cell Membrane Electrode Assembly (MEA) is a critical component in direct methanol fuel cells (DMFCs), which are a type of fuel cell that uses methanol as a fuel source. The MEA is composed of a proton exchange membrane (PEM) sandwiched between two electrodes, typically a cathode and an anode. The PEM facilitates the transfer of protons from the anode to the cathode, while preventing the mixing of the fuel and oxidant streams. In a DMFC, methanol is oxidized at the anode, generating electrons and protons, while oxygen is reduced at the cathode, consuming electrons and protons. The MEA is designed to optimize the electrochemical reactions, ensuring efficient conversion of chemical energy into electrical energy. It is engineered to have high catalytic activity, good mechanical stability, and low resistance to proton transfer, which are essential for the performance and longevity of the fuel cell.
