Report Overview

Atomic Absorption Spectrophotometer for Trace Analysis is a high-precision analytical instrument that uses the absorption of light of a specific wavelength by atoms to quantitatively analyze trace or trace elements in a sample. This instrument is widely used in many fields such as chemistry, environmental science, materials science, and biomedicine, providing reliable data support for scientific research, production, and environmental monitoring. When metal elements are present in a sample, the sample is illuminated by a light source of a specific wavelength, and the atoms in the metal elements absorb the energy of the light, causing the atomic electrons to transition to an excited state. The concentration of the metal element can be determined by measuring the ratio of the intensity of the absorbed light to the intensity of the unabsorbed light, that is, the absorbance. This process follows the Lambert-Beer law ($A = kbc$), where A is the absorbance, k is a constant, b is the optical path length, and c is the sample concentration.
