Abstracts

Impedance-based TEER (transepithelial/endothelial electrical resistance) measurement systems refer to specialized instruments designed to assess cell barrier integrity in cell culture models, specifically epithelial or endothelial cell monolayers. The system uses impedance measurements (usually electrical resistance) to assess the tightness and functionality of these cellular barriers. By passing a low-frequency alternating current through the cell layer, the system measures the resistance encountered, providing valuable insights into the barrier properties of the cell. This technology is widely used in various research fields such as pharmacology, toxicology, and tissue engineering to study cellular responses, drug permeability, and the overall physiological condition of the cell barrier. Impedance-based TEER measurement systems help improve our understanding of cellular interactions and play a vital role in drug development and disease modeling.
