Report Overview

A microinjection system is a precision instrument used to deliver small volumes of substances directly into cells or tissues. It typically consists of a fine glass micropipette, a micromanipulator, and a pressure injector. The micropipette, controlled by the micromanipulator, is used to penetrate the cell membrane or tissue, allowing for the injection of materials such as DNA, RNA, proteins, or other molecules. Microinjection is widely used in biological and biomedical research, including genetic engineering, transgenesis, and cellular studies, as it enables researchers to manipulate the genetic or chemical composition of cells with high accuracy. This technique is essential for creating genetically modified organisms, studying developmental biology, and investigating cellular responses to various compounds. The precision and control offered by microinjection systems make them invaluable tools for experiments that require the direct manipulation of living cells?.
