Abstracts

Micronized Acellular Dermal Matrix (mADM) is a biocompatible material derived from human or animal dermis, which has been processed to remove cellular components while preserving the extracellular matrix structure. The micronization process involves breaking down the acellular dermal matrix into smaller particles, which can be formulated into a paste or injectable form. This matrix serves as a scaffold that supports tissue regeneration and repair by promoting cell infiltration and neovascularization. mADM is particularly used in wound healing, as it provides a structural framework that facilitates the closure of difficult-to-heal wounds, such as those resulting from burns, ulcers, or surgical procedures. It can be applied in various clinical settings, often in combination with other therapies like negative pressure wound therapy (NPWT), to enhance healing outcomes and improve patient comfort and satisfaction.

The global Micronized Acellular Dermal Matrix Madm market size was estimated at USD 125.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
