Abstracts

Microphysiological Systems (MPS) are in vitro models composed of cells, tissue explants, or stem-cell derived 'organoid' formations of human or animal origin. These models provide translational biochemical, electrical, and/or biomechanical responses to represent organ and tissue function, with great potential to replace some animals used in research. According to the U.S. Food and Drug Administration (FDA), MPS model "functional features of a specific tissue or organ of human or animal origin by exposing cells to a microenvironment that mimics the physiological aspects important for their function or pathophysiological condition." These systems are being developed to better mimic some aspects of specific organ systems or combinations of organ systems to improve upon standard two-dimensional (2D) cell systems, with the goal of eventually replacing animal models being used for hazard identification, risk assessment, and disease modeling, among other uses. The global key companies of Microphysiological System include Emulate, Mimetas, InSphero, TissUse, CN Bio, Valo Health (TARA Biosystems), Hesperos, TNO, 28bio, Newcells Biotech, etc. In 2024, the global five largest players hold a share approximately 48.81% in terms of revenue. Due to better policy and financial support in European countries and USA and earlier research, the overall industry of microphysiological system has developed rapidly, and the industrialization process in other regions such as Asia is lagging behind. It is worth noting that because the microphysiological system industry is still in the early stages of development, and the mid-stream and downstream demand has not yet increased, many microphysiological system companies play an upstream role to some extent and mostly conduct organoid and organ-on-chip research on their own. Research and development of chip automation, high-throughput operating instruments and imaging equipment. With the further development of the industry in the future and the implementation of relevant policies and standards, the industry's demand for upstream will increase, which will promote the birth of more professional upstream companies and

the business transformation of some microphysiological system companies.

The global Microphysiological System market size was estimated at USD 126.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.20% during the forecast period.
