Report Overview

A Microwave Door Interlock Switch is a safety mechanism integrated within a microwave oven that ensures the device cannot operate when the door is open. This switch is typically located on the door's frame or latch and interacts with a corresponding component on the microwave's body. When the door is closed, the switch is activated, allowing power to flow to the magnetron, which generates the microwaves. Conversely, when the door is opened, the switch disengages, cutting off power to the magnetron and halting the microwave emission. This feature is crucial for preventing accidental exposure to microwave radiation and ensuring user safety during operation. The design of the switch may vary across different microwave models, but its primary function remains consistent: to serve as a fail-safe that disables the microwave's cooking function whenever the door is not securely closed.
