Report Overview

Mineral Flame Retardants are a class of fire-resistant compounds primarily composed of naturally occurring minerals, such as aluminum hydroxide, magnesium hydroxide, and antimony trioxide. These compounds are specifically engineered to reduce the flammability of various materials, such as plastics, textiles, and building materials, by either slowing down the combustion process or preventing it altogether. They work through multiple mechanisms, including endothermic decomposition, which absorbs heat and cools the material, and the formation of a protective char layer that insulates the underlying material from oxygen and heat. Mineral flame retardants are valued for their effectiveness, thermal stability, and non-toxic nature, making them a preferred choice in applications where health and environmental concerns are paramount.

In 2024, the global Mineral Flame Retardants market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
