### Report Overview

A Miniature Fiber Optical Collimator is a compact and precise optical device designed for the alignment and coupling of light between a fiber optic cable and a free-space optical beam. This device is engineered to minimize size and maximize efficiency, making it suitable for applications where space is limited, such as in telecommunications, data communication systems, and sensor technologies. The collimator features a fiber optic connector on one end for input/output of light signals and an optical lens system on the other end to transform the guided light within the fiber into a collimated beam, which is a parallel beam of light. The miniature design of the collimator allows for integration into tight spaces, while its optical performance ensures minimal loss and high-quality beam output, facilitating efficient light transmission and detection in various applications.
