### Report Overview

Modular nuclear power refers to small-scale nuclear reactors designed for flexibility, scalability, and enhanced safety compared to traditional large-scale nuclear plants. These reactors, often called Small Modular Reactors (SMRs), typically generate between 10-300 MW of electricity and are built in factory-controlled environments before being transported to sites for assembly. Their modular nature allows for incremental capacity additions, reduced upfront capital costs, and deployment in remote or off-grid locations. SMRs leverage advanced passive safety systems and standardized designs to streamline regulatory approvals and construction timelines. They can support diverse applications, including electricity generation, industrial heat, and hydrogen production, positioning them as a potential solution for decarbonizing energy-intensive industries while complementing intermittent renewable sources. The market is driven by growing demand for clean, reliable baseload power, government incentives for nuclear innovation, and the need to replace aging coal plants. However, challenges include high initial development costs, regulatory hurdles, public skepticism, and competition from renewables and natural gas. Key players include NuScale Power, Rolls-Royce SMR, GE Hitachi, and TerraPower, with North America, Europe, and Asia-Pacific emerging as leading regions for pilot projects and commercialization.
