Report Overview

A Modular Rotary Encoder is a type of sensor used in various industries to measure the position, speed, and direction of rotating components. It consists of a modular design, allowing for customization and flexibility in terms of size, shape, and functionality to suit specific application requirements. The encoder typically operates by converting the mechanical rotation of a shaft into electrical signals, which can then be processed and analyzed by control systems or other electronic devices. These signals are generated through the interaction of a rotating disk with a light source and photodetectors, creating a series of pulses that correspond to the encoder's position. Modular Rotary Encoders are known for their high precision, reliability, and durability, making them suitable for applications in automation, robotics, and precision machinery where accurate rotational feedback is critical.
