Report Overview

Molded Underfill (MUF) Epoxy Molding Compound (EMC) is a specialized type of encapsulation material used in the semiconductor and electronics industry. It is a liquid polymer compound that is applied to the underside of a semiconductor chip or component after it has been placed on a substrate or printed circuit board. The primary function of MUF EMC is to provide mechanical support and stress relief to the delicate chip or component, particularly during thermal cycling or other mechanical stresses. This is achieved by filling the gap between the component and the substrate, thereby reducing the likelihood of delamination or cracking. MUF EMC is typically cured after application, forming a solid, protective layer that also helps to manage heat dissipation and moisture resistance. The material is engineered to have specific properties such as low viscosity for easy application, high glass transition temperature for thermal stability, and good adhesion to various substrates to ensure a strong bond.
